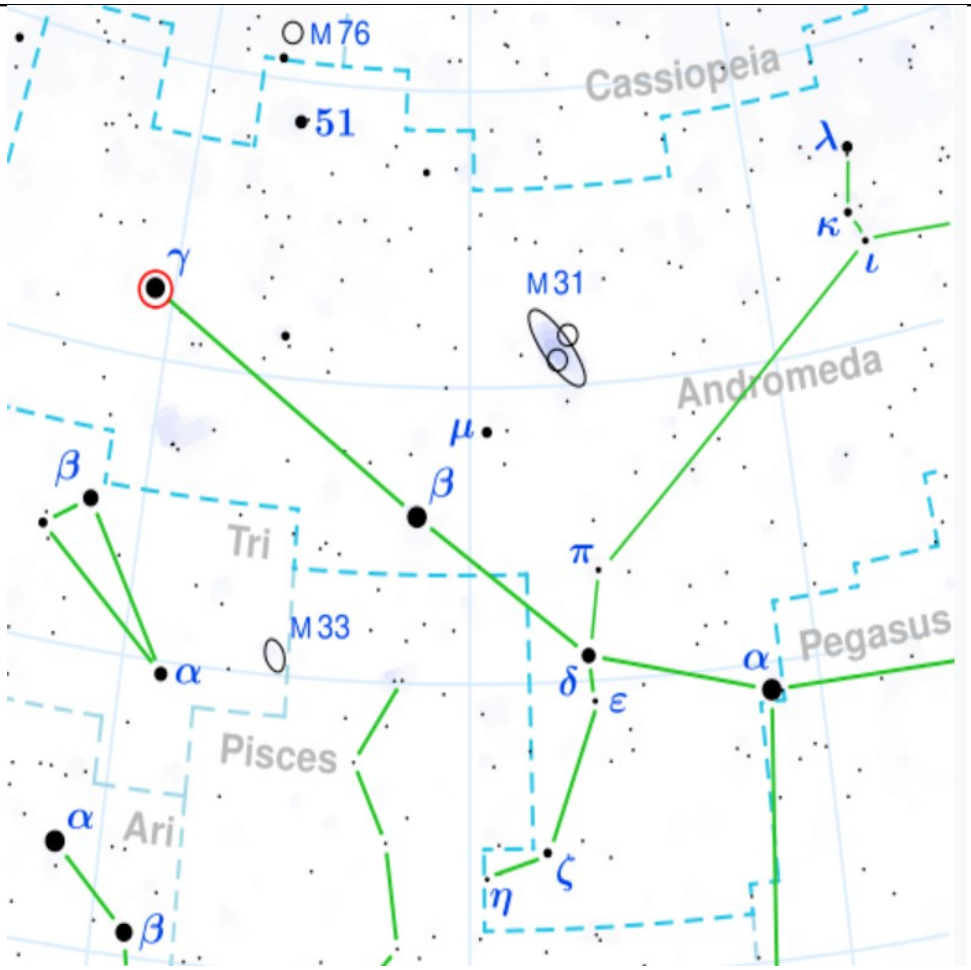
Almach γ Andromedae



Quick Facts:

Distance: 390 Light-years.

Constellation: Andromeda

Gold and blue, beautiful double and binary star. The fainter blue star is a trinary which includes a spectroscopic binary too close to resolve in small scopes. So we are looking at a quaternary star!

Find it: Very easy to find using the Great Square of Pegasus. Follow the NE diagonal and star hop the same direction the three bright stars with Almach the terminal star. GOTO: NAMED STARS.
